You are required to create a migration tool that migrates the following two collection data schema in Mongodb into Mysql

Venue and Venueleadtarget.

The tool should synchronize any new data in Venue into Venueleadtarget.

You can find the model change in venue.js and venueleadtarget.js.

Sample data is available in json format for your use. You can populate the mongodb from the same using the usual command -

mongoimport -h host -d dbname -c collectionname -u <user> -p <password> --file <input file>
